

E-Commerce Platform Architecture

From CRUD to Scalable System

Project Vision

The objective is to transform a basic CRUD system into a scalable e-commerce platform.

The system must support product browsing, cart management, order processing, and administrative control while being extensible for future integrations.

Actors (System Roles)

Core (Now)

- Guest – browse products
- User – purchase products
- Admin – manage products, orders and users

Future Integration

- Vendor – multi-seller marketplace

System Features

Core Features (Now)

- Product listing and details
- Add to cart
- Checkout system
- Order creation
- Authentication (login / register)

Future Features

- Payment gateway integration
- Product reviews and ratings
- Email notifications
- Advanced search and filtering
- Multi-vendor support

Database Design (MLD)

Core Tables (Now)

Table	Description
users	id, name, email, password, role
products	id, name, price, description, stock, image, category_id
categories	id, name
orders	id, user_id, total_price, status, created_at
order_items	id, order_id, product_id, quantity, price
cart	id, user_id

cart_items	id, cart_id, product_id, quantity
------------	-----------------------------------

Planned Tables (Future)

Table	Purpose
product_images	multiple images per product
product_variants	SKU, size, colour, stock per variant, discount price
reviews	user_id, product_id, rating, comment, created_at
payments	order_id, method, status, transaction_id, amount
addresses	user_id, line1, line2, city, state, zip, country
vendors	id, name, contact_info
vendor_products	vendor_id, product_id

Relationships (MCD)

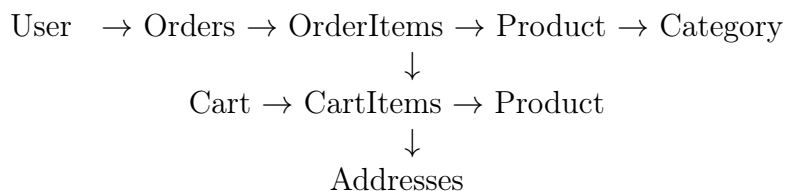

Core Relationships

- User **has many** Orders
- Order **has many** OrderItems
- Product **belongs to** Category
- Cart **belongs to** User
- Cart **has many** CartItems
- OrderItem **references** Product

Future Relationships

- Product **has many** Images
- Product **has many** Variants
- User **has many** Addresses
- Product **has many** Reviews
- Order **has one** Payment
- Vendor **has many** Products

Conceptual Diagram:

Business Logic Considerations

Core (Now)

- Add product to cart
- Create order from cart
- Reduce stock after purchase
- Prevent adding out-of-stock items

Future Enhancements

- Restore stock on cancellation
- Merge guest cart after login
- Payment verification and refunds
- Low-stock alerts
- Review moderation

Order Lifecycle

- pending
- paid
- processing
- shipped
- delivered
- cancelled

Application Pages

Public Pages

- Home
- Product list
- Product details
- Login / Register

User Pages

- Cart
- Checkout
- Order history
- Profile & address management

Admin Pages

- Dashboard
- Manage Products (CRUD, images, variants)
- Manage Orders (status updates, refunds)
- Manage Users & Roles
- Review moderation

Future Pages

- Vendor portal
- Advanced search results
- Wishlist

Security Considerations

Core

- CSRF protection (Laravel default)
- Password hashing (bcrypt)
- Input validation & sanitisation

Future

- Role-based access control (admin vs. user)
- Authorization policies for resource actions
- Rate limiting on sensitive endpoints
- Secure payment webhook handling

Performance Considerations

- Avoid N+1 queries – eager load relationships
- Index frequently queried columns (e.g., `product_name`, `category_id`)
- Cache product listings / popular items
- Pagination for large result sets

Development Roadmap

Phase	Tasks
Phase 1	• Core tables & migrations • Product listing & details • Cart (session + persistent) • Order creation (basic statuses) • Basic authentication
Phase 2	• Admin panel (CRUD for products, categories, orders) • Role-based middleware • Stock management (decrease / restore) • Email notifications (order confirmation, password reset)
Phase 3	• Payment integration (Stripe / PayPal) • Product images & variants • Search & filtering (name, category, price) • Reviews & ratings • Low-stock alerts
Phase 4	• Multi-vendor support • API layer (Laravel Sanctum) • Front-end SPA (Vue/React) optional • Advanced analytics dashboard

Technical Specification Layer

API Design

Core Endpoints (Now)

Endpoint	Description
GET /products	Retrieve all products (paginated)
GET /products/id	Retrieve a single product
POST /cart/add	Add product to cart
GET /cart	View cart items
POST /checkout	Create an order from cart
POST /login	Authenticate user
POST /register	Create new user account

Example Request / Response

POST /checkout

Request:

```
{
  "user_id": 1,
  "cart_items": [
    {"product_id": 2, "quantity": 1}
  ]
}
```

Response:

```
{
  "order_id": 15,
  "status": "pending",
  "total_price": 250
}
```

Validation Rules

Core (Now)

- Product: name (required), price (numeric), stock (integer)
- User: email (unique, valid), password (min 6 chars)
- Order: must contain at least one item
- Cart: quantity must be > 0

Future Enhancements

- Strong password rules
- Email verification
- Product SKU uniqueness

Business Constraints & Edge Cases

Core Constraints (Now)

- Prevent checkout if cart is empty
- Prevent adding products with zero stock
- Lock product price at time of order

Critical Edge Cases

- **Stock Change During Checkout:** re-validate stock before order creation
- **Race Conditions:** use database transactions to avoid overselling
- **Duplicate Orders:** prevent double submission (idempotency)

Future Constraints

- Payment failure handling (retry / cancel)
- Refund logic and stock restoration
- Fraud detection mechanisms

System Boundaries

Handled by Laravel (Core)

- Routing and controllers
- Business logic (orders, cart, products)
- Authentication and sessions
- Database interaction (Eloquent ORM)

External Services (Future)

- Payment gateway (Stripe / PayPal)
- Email service (notifications, verification)
- Search engine (Elasticsearch / Algolia)
- CDN for product images

Deployment Strategy

Environments

- Local: development and testing
- Staging: pre-production validation
- Production: live system

Configuration

- Use `.env` for environment variables
- Separate database credentials per environment
- Debug mode disabled in production

Database Management

- Use migrations for schema control
- Run migrations during deployment
- Seed initial data when necessary

Future Improvements

- CI/CD pipeline (GitHub Actions)
- Automated testing before deployment
- Containerization (Docker)

Conclusion

The project evolves from a simple CRUD application into a structured, production-ready e-commerce platform.

By separating core functionality from future extensions, the architecture remains manageable while providing a clear path for scaling, security hardening, and feature growth.
